

SPLITBOX

Two control heads for the same radio

The Splitbox allows two control heads to the same radio. In an ambulance you can for example use one control head on the dashboard for the driver and one controlhead in the back of the vehicle.

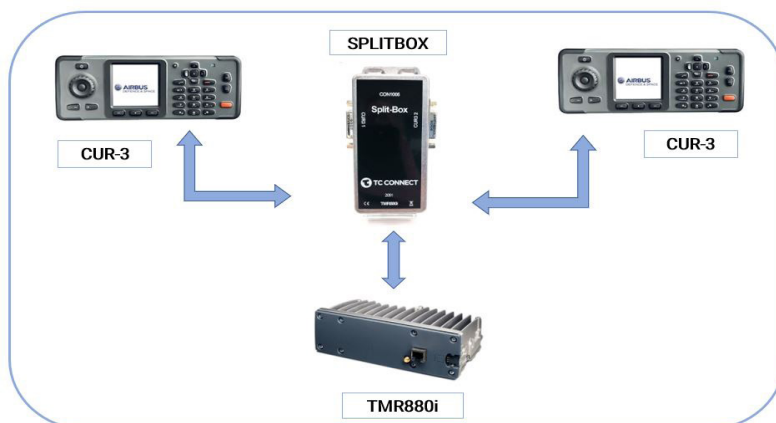

Easy installation

Existing cables are used to the control heads. Simply connect the control heads to the connectors on the splitbox and the single cable to the radio. No external power or connections are needed. The split box is mounted with four screws in the appropriate place and you're ready to go!

Easy to operate

The user who wants to talk on the radio just presses the PTT-button once and to become the active user. After that the user can talk on the radio. A red light on the control head will indicate if that control head is inactive for the moment.

Our Splitbox is a certified accessory by AIRBUS and is available in their accessory catalogue.

Connecting one extra control head to your TMR880i is very easy.
